

ABSTRACT OF THE DISCLOSURE

Method and system for enabling an image capture system to respond to at least one command transmitted by a foreign remote control that is associated with a first device. The image capture system is first trained to respond to at least one command that is received from the foreign remote control. A user can then use the foreign remote control to access at least one function of the trained image capture system. For example, the foreign remote control can be used to access a first predefined function of the image capture system by transmitting a first instruction to the image capture system. The image capture system, responsive to the first instruction, performs the first predefined function.
